# ZINC ... Galvanizing CIF to Work with UNIX

"... the information we possess often has nothing to do with the information we need. It has to do with how the information is packaged and presented to us."

From *Stats*, by Bill James

# A Visit from a User

- No understanding of the DDL discusion
- Overwhelmed by the size and complexity of the mmCIF dictionary
- Not confident that my software will solve their problem.
- Does not have time nor staff to devote to "serious" programming projects - seat of the pants operations

Dave Stampf
BNL Protein Data Bank

# Why CIF does not work with Unix tools

- Line orientation of Unix tools
  - grep, (g)awk, sed, perl
- Field orientation of Unix tools
  - (g)awk, perl, sort
- Position orientation of Unix tools
  - diff, head, tail
- These are all piping tools - very different from many being developed for CIF.

# Which leads to ... ZINC

- A piping format
- block <\t> name <\t> index <\t> value <\t> loop-id
  - new-lines replaced by "\n"
  - comments are included
- This format is accessible to most Unix tools (long lines are sometimes a problem with the older tools)

# Applications

- zincGrep - search a CIF for a regexp
- cifZinc - convert a CIF to a ZINC
- zincCif - convert a ZINC to a CIF
- zincNl - Create a namelist input from a ZINC
- cifdiff - find real differences in CIFs
- zincSubset - Extract a subset of a CIF.
- zb - A simple browser in tcl/tk. << 200 lines
